

Astronomy and Astrophysics

*Graduate Student Adviser: Kyle M. Cudworth, Yerkes Observatory,
262-245-5555*

Student Affairs Assistant: Laticia Rebeles, AAC 120, 702-9808

Departmental Secretary: Stacy Cummings, AAC 118, 702-8203

Web: astro.uchicago.edu/

Astrophysics deals with some of the most majestic themes known to science. Among these are the evolution of the universe from the Big Bang to the present day; the origin and evolution of planets, stars, galaxies, and the elements themselves; the unity of basic physical law; and the connection between the subatomic properties of nature and the observed macroscopic universe.

Three sequences of courses present the study of these topics in different scope and depth:

(1) PHSC 11900-12000-12700 is a two- or three-quarter sequence that satisfies the general education requirements in the physical sciences. The first two quarters cover the formation and evolution of stars, the galaxy, and the extragalactic universe; and the third quarter deals with the solar system. NTSC 10100-10200-10300-10400 is a four-quarter sequence that satisfies the general education requirements in physical sciences and biological sciences. NTSC 10200 deals with the evolution of the universe.

(2) For students seeking a more in-depth examination of selected astrophysical topics, astronomy courses numbered in the 18000s are offered, usually to be taken in their second year or later. These courses are intended for students from throughout the College.

(3) For students considering graduate work in astrophysics, the Department of Astronomy and Astrophysics recommends the program leading to a degree of B.A. in Physics with Specialization in Astrophysics. For details, see the Physics section of this catalog. Tutorial and research courses are available in addition to more informal opportunities for work and study in the Department of Astronomy and Astrophysics. Participation in a weekly seminar on current topics in astrophysical research is also recommended.

J. Carlstrom, F. Cattaneo, H.-W. Chen, J. Cronin, K. Cudworth, S. Dodelson, J. Frieman, M. Gladders, N. Gnedin, D. Harper, Jr., R. Hildebrand, L. Hobbs, W. Hu, S. Kent, A. Khokhlov, E. Kibblewhite, E. Kolb, A. Königl, A. Kravtsov, R. Kron, D. Lamb, Jr., S. Meyer, T. Oka, A. Olinto, P. Palmer, C. Pryke, R. Rosner, N. Swerdlow, S. Swordy, J. Truran, M. Turner, P. Vandervoort, D. York

Courses: Astronomy and Astrophysics (ASTR)

18100. The Milky Way. (=PHSC 18100) *PQ: Any 10000-level general education sequence in chemistry, geophysical sciences, physical sciences, or physics.* In this course we study what is known about our galaxy, the Milky Way. We discuss its size, shape, composition, location among its neighbors, motion, how it evolves, and where we are located within it, with an emphasis on how we know what we claim to know. *K. Cudworth. Spring, 2007. L.*

18200. The Origin and Evolution of the Universe. (=PHSC 18200) *PQ: Any 10000-level general education sequence in chemistry, geophysical sciences, physical sciences, or physics.* This course discusses how the laws of nature allow us to understand the origin, evolution, and large-scale structure of the universe. After a review of the history of cosmology, we see how discoveries in the twentieth century (i.e., the expansion of the universe and the cosmic background radiation) form the basis of the hot Big Bang model. Within the context of the Big Bang, we learn how our universe evolved from the primeval fireball. *A. Kravtsov. Autumn, 2006.*

18300. Searching Between the Stars. (=PHSC 18300) *PQ: Any 10000-level general education sequence in chemistry, geophysical sciences, physical sciences, or physics.* With the advent of modern observational techniques such as radio and satellite astronomy, it has become possible to study free atoms, molecules, and dust in the vast space between the stars. The observation of interstellar matter provides information on the physical and chemical conditions of space and on the formation and evolution of stars. *D. Harper. Winter, 2007.*

18500. The Lives and Deaths of Stars. (=PHSC 18500) *PQ: Any 10000-level general education sequence in chemistry, geophysical sciences, physical sciences, or physics.* In this course, we study the observed properties of stars and the physics that enables us to understand them. Star formation, stellar evolution, and the deaths of stars are discussed. *Offered 2007-08; not offered 2006-07.*

20000. Tutorial in Astronomy and Astrophysics. *PQ: Any 10000-level general education sequence in chemistry, geophysical sciences, physical sciences, or physics. Class limited to six students. Available for either quality grades or for P/F grades.* Students in this tutorial read topics in astronomy and astrophysics under the supervision of a faculty member. Instructors meet with one to three students for approximately two hours each week to discuss readings on topics they choose together. *Summer, Autumn, Winter, Spring.*

21300. Origin and Evolution of the Solar System. (=GEOS 21300) *PQ: Consent of instructor required; knowledge of physical chemistry recommended.* For course description, see Geophysical Sciences. *L. Grossman. Winter. L.*

24100. The Physics of Stars and Stellar Systems. *PQ: PHYS 23400 or consent of instructor.* Building upon a student's previous knowledge of physics, this course

introduces the astrophysics of stars and stellar systems with an emphasis on the physical nature of stars. Topics include the tools of astronomy, both observational and theoretical Hertzsprung-Russell diagrams, structure and evolution of stars, binary stars, star clusters, and end states of stars (e.g., white dwarfs, neutron stars, black holes). *J. Truran. Autumn. L.*

24200. The Physics of Galaxies and the Universe. *PQ: ASTR 24100 or consent of instructor.* Physical laws are applied in the study of the structures and evolution of galaxies, quasars, clusters of galaxies, and the universe at large. *Winter.*

28200. Current Topics in Astrophysics. *PQ: ASTR 24100 and 24200, or consent of instructor.* This course explores in considerable detail an area of current research interest in astrophysics. The topic varies, but recent examples include the early universe, high-energy astrophysics, magneto-hydrodynamics in astrophysics, and observational cosmology. *Spring.*

29700. Participation in Research. *PQ: Third- or fourth-year standing and consent of instructor and departmental counselor. Available for either quality grades or for P/F grades. Students are required to submit the College Reading and Research Course Form. Students may register for this course for as many quarters as they wish; they need not work with the same faculty member each time.* Students are assigned to work in the research group of a member of the faculty. Participation in research may take the form of independent work on a small project or assistance to an advanced graduate student or faculty member in his or her research. *Summer, Autumn, Winter, Spring.*

38600. History of Cosmology. (=CFSC 38800, HPSS 28600) *PQ: Consent of instructor.* Cosmology is concerned with the large-scale contents and structure of the universe. This course considers the history of cosmology from antiquity to the present, concentrating on the period since William Herschel and particularly on the twentieth century. *N. Swerdlow. Winter, 2007.*

Other Courses of Interest

PHSC 11900-12000-12700. Introduction to Astrophysics. *Autumn, Winter, Spring.*

PHYS 29100-29200-29300. Bachelor's Thesis. *PQ: Open to fourth-year students who are majoring in Physics with consent of instructor.* This yearlong sequence is designed to involve the student in current research. The student works on a research project in physics or a closely related field, such as astrophysics, leading to the writing of a bachelor's thesis. The project may be one suggested by the instructor, or one proposed by the student and approved by the instructor. *Autumn, Winter, Spring.*

Qualified College students may register for 30000-level courses with consent of instructor. See astro.uchicago.edu for additional courses.
