CMSC 28100-1 Spring 2016 Homework 4

May 6, 2016

1. (HMU 9.3.1) Show that the set of Turing machine codes for TMs that accept all inputs that are palindromes (possibly along with other inputs) is undecidable.

2. (HMU 9.3.2) The Big Computer Corp. has decided to bolster its sagging market share by manufacturing a high-tech version of the Turing machine, called BWTM, that is equipped with *bells* and *whistles*. The BWTM is basically the same as your ordinary Turing machine, except that each state of the machine is labeled either a "bell-state" or a "whistle-state". Whenever the BWTM enters a new state, it either rings the bell or blows the whistle, depending on which type of state it has just entered. Prove that it is undecidable whether a given BWTM M, on given input w, ever blows the whistle.

3. (HMU 9.3.3) Show that the language of codes for TMs that, when started with blank tape, eventually write a 1 somewhere on the tape is undecidable.

4. (HMU 9.3.5) Let L be the language consisting of pairs of TM codes plus an integer, (M_1, M_2, k) , such that $L(M_1) \cap L(M_2)$ contains at least k strings. Show that L is RE, but not recursive.
